Introduction

The video-assisted thoracoscopic surgery (VATS) approach for combined lobectomy and segmentectomy is an infrequent procedure, rarely reported in the literature. Currently, most of the surgeons still use 2–3 thoracic incisions for thoracoscopic anatomic resections. However, the uniportal approach is gaining worldwide acceptance in the recent years. The main advances of uniportal VATS during the last years are related to improvements in surgical technique by implementing new technology. The experience acquired with the uniportal technique allows expert uniportal VATS surgeons to explore new approaches in order to minimize even more the surgical invasiveness. Recently the aim to avoid the intercostal nerve damage created by the transthoracic incision has led to the creation of a novel procedure entitled uniportal VATS subxiphoid approach. Here we report the first case of a lobectomy combined with anatomic segmentectomy performed through a uniportal subxiphoid approach.

Clinical case

A 53-year-old female was admitted to our department for surgery. The patient suffered from cough, and a CT...
scan revealed two GGO lesions located in the Middle lobe and anterior segment of RUL (S3) respectively (Figure 1). Pulmonary function tests were normal. The patient was proposed for uniportal VATS subxiphoid middle lobectomy and anterior anatomic segmentectomy of the right upper lobe.

Surgical technique (Figure 2)

The procedure was performed under general anesthesia and double lumen endotracheal intubation. The patient was positioned in lateral position with 60 degrees of inclination. The surgeon and scrub nurse were located in front of the patient and the assistant in the opposite side. A 3-cm midline vertical incision was made below the sterno-costal triangle, (longitudinal incision is made when the infrasternal angle is <70°). The rectus abdominis was divided and the xiphoid process was partially resected in order to have more space for instrumentation. Upon finding the infra-sternal angle between the xiphoid process and the subcostal margin, the right pleura was opened by finger dissection via the infra-sternal angle above the level of the diaphragm. The pericardial fatty tissue was removed and a wound protector was placed. The use of a wound protector helps the insertion of the camera and instruments, without the need of a sternal lifter. A 10-mm, 30-degrees video camera and double articulated instruments combined with several specific longer VATS instruments were used through the same subxiphoid incision. The lung was free of adhesions and a middle lobectomy and anterior anatomic segmentectomy of the right upper lobe (S3) were performed. The mean postoperative time was 70 minutes. A single chest tube was placed at the end of the operation through the subxiphoid incision.

Postoperative pain was managed with PCA (Patient-controlled analgesia) pump as required with sufentanyl citrate 1 mL: 50 mcg and regular medication with flurbiprofen 50 mg every 4 hours alternated with paracetamol 1 gr every 4 hours.

The postoperative course of the patient was uneventful, the chest tube was removed on the second postoperative day and the patient was discharged home on the 4th postoperative day with no complications. The final pathology revealed the GGO located on the middle lobe as a 1.2-cm adenocarcinoma in situ and no malignancy was found in the anterior segment lesion of the RUL.

Discussion

The subxiphoid approach is a variant of uniportal VATS approach without opening the intercostal space. It has been employed during the last years for thoracic minor procedures such as thymectomies, pulmonary

Figure 1 CT scan showing the GGO lesions located on the middle lobe (A) and on the anterior segment of the right upper lobe (B).

metastasectomies, pneumothorax (11,12).

However, this technique was recently introduced for major pulmonary resections in selected patients. After reviewing the literature, we have found few cases reporting about the subxiphoid approach incision for lobectomy (9) showing similar values to transthoracic uniportal VATS with regards to chest drain duration, hospital stay, operating time, rate of conversion and complications (8). Based on our previous experience with the uniportal VATS technique, we started to perform the subxiphoid approach for lobectomy with the potential advantage of decreased postoperative pain, better cosmesis and easier specimen retrieval compared to the transthoracic approach (13). Segmental anatomic resections are more complex procedures and require a perfect knowledge of the distal lung anatomy (14). The increased use of low-dose CT for screening will result in more diagnosed lung cancer in the early stage (15) therefore segmentectomy is being performing more frequently. For GGO lesions, anatomic segmentectomy should be sufficient for complete removal without risk of recurrence, and conserves an important amount of normal lung tissue in order to maintain better lung function (16).

To attempt the subxiphoid approach it is mandatory to have a previous experience in uniportal VATS lobectomies and a skilled assistant. As it happens with the transthoracic uniportal approach, bimanual instrumentation is crucial to achieve a good anatomic hilar dissection through a single incision (Figure 3). The view is caudal-cranial and anterior to posterior. The access for the view of the posterior mediastinum is difficult. Particularly challenging and difficult to accomplish is the need to apply traction to the lung in order to assess the lesions as well as the complete resection of subcarinal lymph node dissection. Moreover, this technique has several limitations such as the control of major bleeding and the performance of a complete oncologic lymph node dissection. When an emergent conversion to open surgery is necessary, an extension of the subxiphoid incision is unlikely to be useful and an additional thoracotomy must be performed. Despite these disadvantages, this novel approach has potential for widespread use after the developing of new technology, wireless cameras, instruments adapted to this approach or single port robotic technology also adapted to the subxiphoid approach (17).

Further studies are necessary to certify the feasibility and compare clinical outcomes of the subxiphoid versus other transthoracic approaches, in order to show the clear benefits from this technique.
